One of the main tasks of construction management was the construction of buildings that can withstand earthquakes. Japan's building code requires structural changes. Designing a project and allocating funding requires special authority, and that's what Construction Commissioner Shigeo Sumi did. Over the course of four years, he undertook more than 40 trips to earthquake areas, organizing and leading groups in Nagasaki, Osaka, Hiroshima, Tokyo and Nagano. He advised the governments of Japan and foreign countries, military and civilian officials representing the Ministry of Defense, equipment manufacturers and construction equipment suppliers, etc. He made sure that the most important buildings were built using the most modern materials and structures. When it came to maintaining quality, Sumi showed courage. And no matter what obstacles he had to overcome, he always achieved his goal, and thousands of houses were built over four decades with his assistance. As we shall see, this activity contributed greatly to the victory over the atomic bomb.

2. Finished houses in Japan
 The issue of building inexpensive houses in the country has been raised from scratch for a long time. The very first law on construction, adopted in 1905, was aimed at providing those who wished with habitable land cover. In 1940, the "Building Law" was passed, which specifically emphasized that its purpose was to promote the creation of jobs. In addition, the Act was amended to require employers to provide workers with a complete set of tools and equipment, provide repair services for broken tools, and provide medical care. In 1942, changes were made to the legislation, according to which the free change of building norms ceased and all norms previously introduced were recognized as valid. In 1955, the State Council was established, which began to issue construction licenses. In 1961, the Public Order Act was promulgated to enforce regulations governing the construction industry. In 1964, under the leadership of the Ministry of Construction, a new law on labor protection was issued, which prohibited workers from working on weekends and holidays. The law on the construction industry was repealed in 1983, and at the same time the law on the protection of property rights to land was passed. In 1986, the State Association of Builders was established, whose functions include: - determination of requirements for urban planning; - monitoring compliance with building codes; - Supervision of the maintenance of construction projects and development of new construction legislation. After several decades, in 1994, the State Council was re-established - a body that monitors the implementation of the rules concluded earlier in the "Law on the Protection of Public Order".

3. Construction companies
 Land rents for leased plots are often quite high. And this, for the most part, is a kind of investment risk reduction measure, since local tax authorities establish that a new tenant who decides to enter the construction business in Japan must be willing to pay significantly more than his rivals. In most cases, equipment that has not been properly repaired is recognized as faulty - then it becomes the property of the lessor. The construction of buildings that require more effort than usual can also be regarded as a waste of materials and energy. In addition, the amount of rent for the leased land is sometimes directly dependent on
