For each different type of note, there are three possible types of a chord (constituent notes) : Open Pitch change No pitch change The first one is represented by playing the base note of the scale. The second type is represented by playing the note a semitone higher than the base note. The third type is represented by playing two notes simultaneously. This type is particularly useful to play chords containing two notes that belong to the scale or to use a harmonization. If you play a note on the keyboard with a velocity value greater than zero, the Wmidi will play it using the technique of a vibrato : There are two main modes in which the Wmidi can be used : Free Mode: A Wmidi in free mode means that it is not locked on any particular instrument, scale, or parameter. For this kind of mode, the Wmidi can be used as a MIDI controller. Instrument Mode: A Wmidi in instrument mode means that it is locked on a particular instrument, scale or parameter. This mode can be quite useful for turning the Wmidi into a guitar or keyboard application. Whether in free or in instrument mode, the Wmidi can generate notes in different parts of the musical spectrum. It is capable of generating notes in a gamut of different natures. Bass/treble sliders : Auto pitch adjustment Auto change volume Some earwitness soft synth software (such as Hype or Helix) allow you to specify the relative frequencies of the bass and treble sections of the sound. Wmidi is a customizable drum machine which writes MIDI files. The drum sounds are available in MIDI, musicXML or MP3 format. Wmidi comes with a mixer, which is a simple sequence of steps to create a drum track. The mixer has a sequencer which is based on the project sequencer in MusicXML. The sequencer can be used to control a drum machine. It also can be used to control the volume and pan of each track. It can support any number of tracks and any number of devices that can be controlled. Each device can be either a MIDI channel or a dynamic track. MIDI channels and dynamic tracks can be joined or split by control change message and they can be split into two device classes: MIDI channels and dynamic tracks. The sequencer has a loop editor to set a loop duration and set tempo. This makes it possible to play any song in the sequencer without writing a single note. The loop editor allows you to control the duration of the MIDI notes in the loop. You can set up a MIDI event to be sent when the loop is finished. This means the sequencer makes it possible to play back any song. The sequencer supports any step sequencer like groove, beat or basic, overshoot or kick effects. The sequencer has a crossfade and step sequencer controls, which makes it possible to play a file while keeping the speed of the sequencer. For example, in a groove mode, a song like Oasis "Wonderwall" (by Oasis) plays while the groove moves on a set tempo (the same tempo as the mixing tempo). The sequencer can be controlled by MIDI and, for this, it has a mixer that allows you to control the various steps of the sequencer and set up the transport controls. Each step of the sequencer is controlled by MIDI. When the sequencer plays a song, the file that the MIDI and sequence files are compiled into, is written. This can be an MP3, Wave or MusicXML file. Wmidi provides the possibility to load and edit songs. To do so, the Mixer tracks and the sequence files are loaded, and the source files are edited. Each step can be edited. The type of the track can be changed from MIDI channel to a MIDI track, musicXML or MP3. Audio tracks can be edited and can be attached to a dynamic track. The dynamic track can be connected to a sequencer track and the sequ
