forms that are submitted to a database for processing. The database stores a record for each form with a unique ID and some data fields. A record can have new fields created for future submissions that will not be submitted to the database. The existing fields should already exist in the database, but users are allowed to add new ones and submit to the database. New records should be validated, i.e. if a new field name is not a valid field name then it should not be added to the database. How would I go about doing this? I have seen examples of how to check for missing, invalid, or duplicates in an existing record, but I cannot figure out how to validate a new field. A: Not sure if this is a complete answer,
